ABSTRACT: Artificial Intelligence (AI) is redesigning the *status quo* and transforming the world as we know it. The promises for a better and improved (as well as different) life are enormous. Although the downsides and risks related to AI and AI-based systems are also palpable. In fact, there are no doubts AI presents both benefits and risks at a human rights (HR) level, to democracy and the Rule of Law. Concerns about privacy, freedom, labour, health, equality, or non-discrimination, among others, are at the epicentre of the discussion and it creates a tangible tension between supporting innovation and promoting fairness. AI is also changing the way we access and interpret information, the way we decide, including as members of a politic society, and the way we participate in the democratic process. AI also plays a critical role in the way private and public institutions function, and it will come the moment (if not already) that it influences the way governments operate. Within this framework, this Chapter has the overarching aim to map the impacts AI and AI-based systems have on individuals and societies at a HR level and outline the contour of a HR-centered ethical approach to guarantee an Ethical AI, in its design, development, and deployment.

KEYWORDS: Artificial Intelligence; AI-based Systems; Ethics; Human Rights; International Human Rights Law; Democracy; Rule of Law.

SUMÁRIO: **1.** Introdução. **2.** Análise geral das políticas da UE à IA. **3.** O próximo capítulo: algumas notas sobre os desafios da IA; **4.** Os direitos humanos, democracia e Estado de Direito no domínio da IA. **5.** No caminho para uma IA ética. **6.** A literacia para a IA para um diálogo democrático e o desenvolvimento sustentável ético-legal. **7.** Conclusões. **8.** Nota acerca da metodologia. **9.** Agradecimentos. **10.** Competing interests. **11.** Financiamento. Referências.

RESUMO: A Inteligência Artificial (IA) está a redesenhar o *status quo* e a transformar o mundo como o conhecemos. As promessas de uma vida melhor e melhorada (e também diferente) são imensas. Não obstante as desvantagens e os riscos associados à IA e aos sistemas baseados em IA também são palpáveis. De facto, não temos dúvidas que a IA apresenta benefícios e riscos e em qualquer vertente o impacto projeta-se ao nível dos direitos humanos, bem como na democracia e no Estado de Direito. Preocupações com a privacidade, liberdade, trabalho, saúde, igualdade ou não discriminação estão no epicentro do debate, o que gera uma tensão tangível entre a inovação, e o apoio ao desenvolvimento, por um lado, e a promoção da equidade por outro. A IA está a mudar a forma como acedemos e interpretamos a informação, a forma como decidimos, incluindo como membros da sociedade política, e a forma como participamos no processo democrático. A IA também desempenha um papel vital na forma como as instituições, públicas e privadas, funcionam e influenciará (se já não o faz) a forma como os próprios governos operam. Nesta visão, este Capítulo visa sobretudo explorar e mapear o impacto da IA, e dos sistemas baseados em IA, nas pessoas e nas sociedades ao nível dos direitos humanos e delinear o contorno de uma abordagem ética centrada nos Direitos Humanos para garantir uma IA Ética, no seu design, desenvolvimento e implementação.

PALAVRAS-CHAVE: Inteligência Artificial; Sistemas baseados em Inteligência Artificial; Direitos Humanos; Ética; Direito Internacional dos Direitos Humanos; Democracia; Estado de Direito.

1. Introduction

AI ¹ and AI-based systems are part of our day-to-day life and there is no turning back. AI makes our lives easier and, generally, better.

From our virtual personal assistants and self-driving vehicles to robots ^{2, 3, 4, 5, 6} (and robotic industry), to health care ^{7, 8, 9, 10}, economy, health, privacy, information ¹¹, military, and many other sectors, AI and related technologies are pushing the boundaries – for good and, in some levels, it could be for the worst – fueled by Big Data ^{12, 13}.

However, what is AI (and AI-based systems)?

The answer is not as simple as we might think.

For instance, the European Commission's Communication on AI defines AI as «[...] *systems that display intelligent behavior by analyzing their environment and taking actions – with some degree of autonomy – to achieve specific goals.*» ¹⁴ AI include AutoML ¹⁵ and machine learning (ML) ^{16, 17}. Although, a few months later, the European Commission's High-Level Expert Group on Artificial Intelligence defined AI and ended up proposing a new updated definition, that

«[...] refers to systems designed by humans that, given a complex goal, act in the physical or digital world by perceiving their environment, interpreting the collected structured or unstructured data, reasoning on the knowledge derived from this data and deciding the best action(s) to take (according to pre-defined parameters) to achieve the given goal. AI systems can also be designed to learn to adapt their behaviour by analysing how the environment is affected by their previous actions. As a scientific discipline, AI includes several approaches and techniques, such as machine learning (of which deep learning and reinforcement learning are specific examples), machine reasoning (which includes planning, scheduling, knowledge representation and reasoning, search, and optimization), and robotics (which includes control, perception, sensors and actuators, as well as the integration of all other techniques into cyber-physical systems).» ¹⁸

On 2021, the EU Draft Act on AI, in its Article 3, point 1, defines AI system as a

«[...] software that is developed with one or more of the techniques and approaches listed in Annex I¹⁹ and can, for a given set of human-defined objectives, generate outputs such as content, predictions, recommendations, or decisions influencing the environments they interact with.»²⁰

Although, on early March 2022, the European Committee of the Regions (ECR) has published amendments to the AI Act, including the definition itself of AI. The Amendment 2 refers that the AI systems *«[...] is an ongoing process that should take into account the context in which AI operates, keep pace with social developments in this field and not lose sight of the link between the ecosystem of excellence and the ecosystem of trust»²¹*, reasoning that that AI requires and adaptive and evolving approach. Adding, on Amendment 30 that the list on Annex 1 should not be exhaustive *«[...] and it must be clear that it is based on the current scientific state of play.»²²*

Saying this the Committee proposes the following definition (Amendment 16) of AI systems means:

«[...] software that is developed with one or more of the techniques and approaches listed (non-exhaustively) in Annex I, combined with social practices, identity and culture, and that can, for a given set of human-defined objectives, by observing its environment through collecting data, interpreting the collected structured or unstructured data, managing knowledge, or processing the information derived from these data, generate outputs such as content, predictions, recommendations, or decisions influencing the environments they interact with;»²³

We can understand the importance of the definition since it sets the scope of the legislative frameworks however, the concept is volatile, and it mostly depends on the approach adopted and how flexible we want the definition to be.

Despite the approach adopted,²⁴ the fact is that *intelligence* is now (also) a(n artificial) process²⁵ and a digital revolution is in course. Although AI is expected to bring benefits, there are tangible implications at not only a human rights level, but also democracy and the rule of law. For that reason, a «human-centric approach» to AI is pledged by policy-makers^{26, 27, 28}.

2. Overview of the EU's policy approaches to AI

The EU, besides a soft law approach is also delivering a specific regulatory framework about AI ²⁹. It was already recognized the need to build a European strategy for AI.

In addition, the USA recognized the main purposes, among others, to ensure the US leadership in AI research and development lead the world in the development and use of trustworthy AI systems and prepare the USA workforce for the integration of AI systems across all sectors of economy and society ³⁰.

The US law has some recent developments.

On February 3, 2022, it was reintroduced the bill «Algorithmic Accountability Act of 2022» – with some minor updates since the 2019 version – to the Senate ³¹ and the House of Representatives ³². The Act

«[...] aims to hold organizations accountable for their use of algorithms and other automated systems that are involved in making critical decisions which affect the lives of individuals in the U.S. Among other requirements, the U.S. Act would mandate covered entities to conduct impact assessments of the automated systems they use and sell in accordance with regulations that would be set forth by the Federal Trade Commission (“FTC”). » ³³

On April 10, 2018, 25 European countries signed a declaration of cooperation on AI. The Member States recognized that AI could solve key challenges, and Europe's competitiveness should be assured in the research and deployment of AI.

Although AI also brings new or renewed queries and legal and ethical questions that should and need to be addressed ³⁴.

The European Commission, in its 2018 communication, aligned the position built on the declaration of cooperation, and recognized the EU «[...] *should be ahead of technological developments in AI and ensure they are swiftly taken up across its economy.*» ³⁵, ³⁶.

Ursula von der Leyen's political guidelines ³⁷ also aligned to these goals and included a topic on an «Europe fit for the digital age», recognizing that «[d]ata and AI are ingredients for innovation that can help us find solutions to societal challenges [...]» ³⁸.

A shared commitment with the USA.

The EU-US Trade and Technology Council (TTC) affirm the goals to «[...] *coordinate approaches to key global technology, economic, and trade issues; and to deepen transatlantic trade and economic relations, basing policies on shared democratic values*». The EU and the USA are clearly committed in working together «[...] *to ensure that AI serves our societies and economies and that it is used in ways consistent with our common democratic values and human rights.*»³⁹

The Commission's communications - «Shaping Europe's digital future» and the «A European Strategy for Data» - emphasize the goal that is wanted a «[...] *European society powered by digital solutions that are strongly rooted in our common values, and that enrich the lives of all of us [...]*»⁴⁰ and «[...] *Europe aims to capture the benefits of better use of data, including greater productivity and competitive markets, but also improvements in health and well-being, environment, transparent governance and convenient public services.*»⁴¹

Processing data and training AI is also a major challenge and computer capacity is essential to take over the task, as recognized already in 2019 by the European Commission⁴².

The European High-Performance Computer Joint Undertaking (EuroHPC JU) – a joint initiative between the EU, European countries, and private partners – are developing the next generation of world-leading supercomputing and data infrastructure in Europe, to improve Europe's scientific excellence and industrial strength, support economic digital transformation and ensure technological sovereignty⁴³.

In the White Paper on Artificial Intelligence⁴⁴, it is recognized that AI is a strategic technology and the «European approach for AI» is centred in promoting «[...] *innovation capacity in the area of AI while supporting the development and uptake of ethical and trustworthy AI across the EU economy*»⁴⁵.

The initiative was preceded by a public consultation which is most relevant to collect stakeholders' opinions⁴⁶. Moreover, the accompanying report on the safety and liability implication of artificial intelligence, the internet of things and robotics⁴⁷.

On 2021, the European Commission run a public consultation (from October 2021 to January 2022) on the inception impact assessment about the Commission's plans about the initiative of Adapting liability rules to the digital

age and circular economy⁴⁸. The Commission adoption is planned for the third quarter of 2022.

The above mentioned report emphasizes the challenges created in terms of liability of the new digital technologies and those «[...] *liability related challenges need to be addressed to ensure the same level of protection compared to victims of traditional technologies* [...]»

The 2021 Communication from the European Commission addressed the necessary deployment of trustworthy AI as a pre-condition for Europe's future competitiveness and prosperity⁴⁹.

In addition, the European Parliament adopted several resolutions on AI, e.g., on the matters of ethics⁵⁰, civil liability⁵¹, intellectual property⁵², criminal law and AI use by the police and judicial authorities in criminal matters⁵³, and education, culture, and audiovisual sector⁵⁴.

The Parliament also set up a Special Committee on AI in a digital age (AIDA). The Committee is vested to analyse the future impact of AI in the digital age on the EU economy, investigate the contribution of AI to business value and economic growth, analyse the approach of third countries and to submit to Parliament's responsible standing committees an evaluation defining EU objectives in the medium-and long-term⁵⁵. The Special Committee adopted its final recommendations in March 2022, and it will be put to vote by the full house in May 2022.

On 2019, the Independent High-Level Expert Group on Artificial Intelligence set up by the European Commission released their Ethics Guidelines for a Trustworthy AI⁵⁶. In the report, the group establishes three main components for a trustworthy AI.

It should be lawful, ethical, and robust.

All of the components are necessary itself but not sufficient «[i]deally, all three components work in harmony and overlap in their operation.»⁵⁷

However, besides some soft law instruments adopted by the Commission, such as the above-mentioned Ethics Guidelines for Trustworthy AI⁵⁸, the legislative major milestone to the date was achieved in April 2021⁵⁹. The European Commission unveiled a regulatory framework on AI systems and the associated⁶⁰.

The AI Act clearly sets the goal to establish a legal and harmonized framework on the digital governance, set up in a risk-based approach⁶¹, considering the fundamental rights of the EU⁶², and the values of the Union⁶³, to foster investment

and innovation in AI, enhance governance and enforcement, and encourage the single European AI market.

A coordinated European approach to deal with AI is on its way and reveals a commitment to a key dossier, putting EU as a world-leader in AI matters and setting a tone to Member-States in their national AI strategies.

The principle set by the Commission is that «*AI should work for people and be the force for good in society*»⁶⁴, including the core values of the Union, summarized in the Pittsburgh Statement, such as the respect for human rights, environmental protection, the rule of law, non-discrimination, regulatory transparency, market-based commerce, and the freedom to innovate and to have innovations protected⁶⁵.

3. The next chapter: some remarks on AI challenges

We can summarize the AI challenges into five categories following Powers and Ganascia. «[C]onceptual ambiguities, the estimation risks, implementing machine ethics, epistemic issues of scientific explanation and prediction, and oppositional versus systemic ethics approaches».⁶⁶

The regulatory efforts on AI, either on a soft law approach, but also the recent hard law regulatory efforts, many of which led by the EU, are aligned to address them.

Although the arena in which AI is moving is treacherous, but also highly seductive. Finding a balance from a precautionary approach to promoting evolution is not always easy, especially when dealing with confronting interests, different regulatory levels, social and economic asymmetries, and cultural differences, besides the impact in the future generations' way of life.

However, despite the differences and asymmetries, technological development brought to our lives many of the science fiction scenarios, that are not fictional anymore, and we entered a new era in the history of the world.

This new chapter of world history is presenting a new *humanoid species* that can parallel human beings⁶⁷,⁶⁸ at the *top of the food chain*. Bill Joy's cautionary essay talks about a new Pandora box⁶⁹ and how it threatens the human species⁷⁰.

The growth of *techne* assumes, in the words of Hans Jonas, ethical significance considering the central place it occupies in human purpose⁷¹ like in no

other issues; anticipation has never been such an imperative, especially considering that we are also changing, in fact, the very nature of the human actions. Just have in mind, for instance, robots and their interaction with humans. Robots that can, not only, interact with humans but also cooperate in a truthful human-robot interaction ⁷². With social robots, human-like decision-making skills are sought to increase their capability to deal with humans, but also our own empathy towards the machine considering the human resemblance about their attitudes and responses ⁷³.

AI and AI systems will exceed human performance and we may well be at the dawn of the next chapter in world history: «*Artificial super-intelligence versus you and me.*» ⁷⁴

In a rather dark perspective professed by Irving John Good, the *deus ex machina* will kill its creator ⁷⁵ in a similar perspective «*Nietzsche made in God's image turned and philosophically sought to kill man*» ⁷⁶. In fact, the potential of AI is, as Bostrom states, «[...] *vastly greater than that organic intelligence.*» ⁷⁷

Truth is that cognitive computing is *potentially* able to imitate or overcome human cognitive capacities, «[...] *on the basis of algorithms that embody 'machine learning' or even 'deep learning', using 'neural networks' that mimic the functioning of the human brain*» ⁷⁸.

But if modelling the human brain is a task to be fulfilled, AI is built in a data-driven approach – based on artificial neural networks (ANNs) ⁷⁹ – and, such systems, learn to perform tasks ⁸⁰ considering examples (labelled data) without being programmed with any task-specific rules or models ⁸¹ and are capable to execute them without, or very little, human involvement ⁸². For instance, autonomous vehicles are capable of sensing the environment they are in. Nevertheless, if so, on another layer, like any human driver, it may be confronted with moral dilemmas. Think about the typical example. An accident where it's not possible to avoid hitting or hurt someone. The algorithm will choose who is sacrificed. The decision is based on logic and determine how the robot should act. How about common sense, empathy? How about moral?

Although, let us confront with an ethical query

«[A] robot is walking to the post office to post a letter. [...] Suddenly a toddler chases a duck which hops into the stream. The toddler slips and falls into the water

*which is one meter deep. The toddler is in imminent danger of drowning. The robot is waterproof. [...]»*⁸³

What should the robot do?^{84, 85} Post the letter or save the child? The answer is morally simple, but the robot does not *feel* empathy and, to solve this query it needs rules to make a decision, i.e., to walk away from its chore and feels the urgency of the situation and act accordingly.

If we take ethics to concern, the question is «[...] *what would it take to build an ethical AI that could make moral decisions?*»⁸⁶

Although, assuming a moral decision would presuppose a pre-requisite; a recognition of a moral personhood. However, is it possible to recognize Artificial Moral Agents? In addition, these artificial agents would, if so, have rights and responsibilities?⁸⁷ Would we recognize a new, and we use Agamben's term provocatively, *homo sacer*⁸⁸? And, eventually, we would/could recognize it as one of us, identifying an artificial morality or even a *sacrum* that is able or could surpass human beings?

Considering this question, what kind of a moral status AI could have, if some? And, if it does, or it will might have, «*How would we know whether or not we succeeded in creating genuine Artificial Moral Intelligence (AMI)?*»⁸⁹

On another layer, AI-guided genetic-engineered nanotechnology, and robotics (AI-GNR) presents itself as a technological transformative-revolution⁹⁰ including the transformation or, for some, an improvement, of the human body and human self⁹¹. Of ours and the self's of the future generations.

For instance, the genetic genome editing (GGE). GGE is a

*«[...] set of technologies, including a new tool based on the CRISPR/Cas9 mechanism discovered in Streptococcus pyogenes. The system can be engineered to facilitate the targeted modification of specific DNA sequences in the genomes of living cells»*⁹².

We are at the dawn of the *posthuman* era⁹³.

In this matter, we are the responsible creators of the next generation genetic modified humans, the *GenRich* humans⁹⁴. Although these mutations «[...] *can never subsequently remove and will have to hand down not just to her own children but to all subsequent descendants*»⁹⁵.

The co-existence of Naturals and Genrich, using Silver's terms, or the emergence of post-persons, as Nicholas Agar refers to, can create not only a stratification of human beings, in the opposite direction of the human dignity principle, but can also lead, as Agar refers to, to the entitlement of the post-persons to demand sacrifices from human mere persons, as we now sacrifice sentient nonpersons ⁹⁶.

The *Homo Artificialis*, in a transhumanist ⁹⁷ perspective, represents the «*Homo Sapiens Sapiens accède au gouvernement de sa propre constitution*» ⁹⁸, a truthful liberation – for some – of the human species ⁹⁹, ¹⁰⁰ from the limits of the body and, in some ways, of the self.

Habermas has a profound reflection about the intervention in human creation and the control over human nature that can lead to «*changes [in] the overall structure of our moral experience*» and the understanding of the individual's self.

In a stratospheric dimension, followers of Singularity ¹⁰¹, AI will eventually «*[...] merge with human brains and become an all-seeing, all-powerful, super-intelligence. For true believers, computers will augment and extend our thoughts into a kind of "amortality."*» ¹⁰², ¹⁰³. Although, acting upon human beings, in particular in cognitive enhancements that Bostrom summarizes three conclusion about a strategic cognitive enhancement:

- «(1) *at least weak forms of super-intelligence are achievable by means of biotechnological enhancements;*
- (2) *the feasibility of cognitively enhanced human adds the plausibility that advanced forms of machine intelligence are feasible [...]; and*
- (3) *[...] the probable emergence of a generation of genetic enhanced populations – voters, inventors, scientists – with the magnitude of enhancement escalating rapidly [...]*» ¹⁰⁴.

The action has the *virtue* of pushing natural selection to produce high-quality individuals brings back to memory dark episodes of the world history ¹⁰⁵.

Another set of examples, in a different level, that brings other considerations, is a cultural and intellectual dimension of AI.

When AI gets artistic, and the algorithms not only create outputs but create art. In 2016 the “next Rembrandt” was created ¹⁰⁶. The Microsoft Project examined the artistic Rembrandt DNA. To create the “next Rembrandt” the entire

collection was examined, and it was studied the contents of Rembrandt's paintings pixel by pixel. The database was used as for the new artistic creation.

In the same dimension, in 2019, AI created music. Not some music, Shubert's music. AI neural network finished the symphony of Schubert, *powered by Huawei AI* ¹⁰⁷.

Besides the intellectual property (IP) rights ¹⁰⁸, there is also another array of interrogations that the matter arises. How do we feel about a creative non-human intelligence *surpassing* the human creation? Or, as in these examples, how do we feel about the non-human intelligence beaten the creator's mortality? How do we justice creativity? What is the value of human vs. non-human creativity? In addition, what is the place of these artistic creations in our cultural heritage?

Another issue that raises concern is related to autonomous weapon systems. These systems «[...] *select and apply force to targets without human intervention.*» ¹⁰⁹

The International Committee of the Red Cross (ICRC) reinforces the risks associated to these systems, which have a license to kill with loss of human control and, mainly, without human judgment.

The ICRC specially addresses concerns about legal perspectives, but also, ethical and humanitarian ¹¹⁰. Providing a moral analysis to this topic will lead concerns related to civilian casualties and threats to HR, instability, unpredictability, responsibility, but also, hacking and cybersecurity ¹¹¹.

The examples are presented as mere illustrations about the two sides of AI. If AI has a strong potential to enhance individual rights, social benefits and promote economic growth, on the other side, it raises equally great and palpable concerns, especially at the human rights level.

4. Human rights, democracy, and the rule of law to the AI domain

A trinitarian commitment to human rights, democracy, and the rule of law is, in the words of Mattias Kumm, « [...] the dogma of the constitutionalist faith» ¹¹².

Starting with the same reference, Paul Nemitz questions how new technology must be shaped to support the maintenance of constitutional democracy ¹¹³. The author starts from a holistic look on the reality of technology and the accumulation of *digital* power in the hands of the «frightful five» ¹¹⁴ that can lead to

*«[...] rises in stock market valuations, and therefore wield economic power which does not only guarantee disproportionate access to legislators and governments, but also allows them to handout freely direct or indirect financial or in kind support in all areas of society relevant to opinion building in democracy: governments, legislators, civil society, political parties, schools and education, journalism and journalism education and — most importantly — science and research.»*¹¹⁵

In democratic processes, the misuses of AI are not new. Just consider electoral manipulation narratives.

The Cambridge Analytica scandal is one of the most palpable examples. It exposed unlawful *«[...] harvest Facebook data from millions of voters in the United Kingdom, the United States, and elsewhere enable malign actors to engage in political micro-targeting through the use of AI-driven social media content distribution systems [...].»*¹¹⁶.

The scandal had worldwide proportions and it showed how is easily possible to interfere with democratic election processes and influence political decisions.

In fact, AI systems are much more capable to subvert information and condition our choices, jeopardise freedom of choice and our right to receive truthful information, without interference.

It is undeniable that, in every aspect of our lives, individually and as members of society, algorithms play, nowadays, a critical role including the information *selected* to the way we analyze or interpret data and, subsequently, the decisions we make¹¹⁷.

Technology has also been used to blurry the lines of truth.

Considerer the issue of disinformation by fake news which can be potentialized by digital tools. The deepfake is a AI based technology that can be defined *«[...] within the intersection of technology and communication and/or visual representation as ‘a technology that uses Artificial Intelligence to produce or edit contents of a video or an image [...].»*¹¹⁸. An image is morphed in another image or video to produce content that does not exist. It is a product of deep learning, and the process employs Generative Adversarial Networks (GANs) that can produce a novel content. This content can be released and spread, especially on social media. To maximize the potential the *«Digital Influence Machine»* has the aim to make the message reach the *right* people¹¹⁹.

We can understand immediately the implications of deepfake news around consent for instance, although truth is that repercussions can be even more profound. Just consider political deepfake for instance. If fake news, in general, have the ability to threaten democracy itself, deepfake not only can be used to the same goal but also enhance the potential alarmingly. One of the clearest examples of the last years were the 2016 and 2020 US presidential elections.

A study of Hunt Allcott and Matthew Gentzkow about the 2016 American elections reveals that fake news «[...] *was both widely shared and heavily tilted in favor of Donald Trump.*»^{120, 121} The authors do not claim or conclude that fake news have been pivotal in the 2016 US presidential election, but it was estimated that the average of US adult read, at least, one fake news article during election period with higher exposure to pro-Trump articles¹²².

In the political deepfake arena, the hyperrealism poses a different level of menace. What to do if we cannot trust what we see anymore? Probably one of the most well-known examples of deepfake is the video of a drunk Nancy Pelosi¹²³ and, recently a deepfake video of the Ukrainian President, Volodymyr Zelensky, telling his country people to surrender¹²⁴.

Key decisions on AI development need a democratic debate and a multiple public engagement, from different stakeholders, from the North and South of the Globe, in a global dialogue, not only related to economic, social, and regulatory policies, but also diplomatic and political¹²⁵.

Truth is that the main issues in AI relate, among others, with accessibility, integrity, privacy, safety, bias, explainability and transparency.

These challenges were addressed in the coordinated plan on AI¹²⁶ and the 2021 review proposed key actions on how to create EU global leadership and trustworthy AI, such as accelerate investments in AI technology, act on AI strategies and programs, and align AI policy¹²⁷ to remove fragmentation¹²⁸.

The impact of AI and AI systems in people's lives and in societies in general has been calling for a HR approach and response to the increasing pressure it has been placing on human rights and the human rights discourse.

In sum, HR and fundamental freedoms that can be impacted by AI systems are, among others: human dignity, freedom, autonomy, fairness, non-discrimination, equality, diversity, privacy, data protection, democracy and the rule of law, besides cultural, social, and economic rights.

5. On the route for an ethical AI

The father of AI is recognized to be Alan Turing¹²⁹ that, in the 1950's published the well-known article «Computing Machine and Intelligence» and set the tone for the discussions we are still having nowadays. Alan Turing replaced the key question «*Can machines think?*» to the Turing Test (TT)¹³⁰.

The TT departs from an imitation game¹³¹ to a new question: «*What will happen when a machine takes the part A of this game?*»¹³². Turing also recognized the difficulty of the learning machines and how the process should be similar to the education process of a child, making an

«[...] obvious connection between this process and evolution, by the identifications
Structure of the child machine = Hereditary Material
Changes of the child machine = Mutations
*Natural selection = Judgement of the experimenter»*¹³³

Although, the learning process is, recognizably, complex, and how suitable it could be for a «child machine», mainly having in consideration that the pupil can be far more intelligent and have more knowledge than the professor, is one of the multiple questions that arise.

However, not being our goal to analyze Turing's work, it is impossible not to recognize the influence on the topic, and especially the mimic between humans and machinery evolution, and the multilateral connections between the two.

The machine learning process is particularly interesting at this level since – considering human learning – it is no one way process, there is a mutual flux, not only from the teacher to the student, but also vice versa¹³⁴.

In addition, a particular aspect of the work arises, and it's related to the correlation between language – and its multiple opacities – to cognitive abilities and knowledge. Moreover, knowledge is complex and «*[t]o create flexible intelligence in our machines we need to automate the knowledge-acquisition process.*»¹³⁵ To achieve that, in Kurzweil's words, it is imperative to create a way the system can model and understand human language and knowledge¹³⁶.

In a particularly interesting analyses of Turing's TT, Saygin, Cicekli and Akman conclude that it is about simulating human use of language by computers but, as they put it, it raises a new set of questions:

*«How do humans use language in similar settings? What is the relation between language and cognition? Is language autonomous with respect to other cognitive abilities? How can computers be made to understand language? What does a “simulation” mean, anyway?»*¹³⁷

The correlation between language and knowledge and the process of learning is rather important since, the progression from the human child and machine learning, follows reverse directions¹³⁸. Children start listening and understanding spoken language and then written language, and machines start with written language and then understanding it, and only after listening and then understanding spoken language¹³⁹.

One of the most puzzling challenges is that, as Ammanath recalls, AI does not understand what it accomplishes since «[...] *unlike humans, AI lacks an internal model of the world*»¹⁴⁰.

Besides all of this, another variable needs to be considered.

The machine learning process needs to be built upon a set of principles. However, which ones? One of the most the most popular machine (pseudo-)ethics came from Isaac Asimov's Laws of Robotics in *I Robot*.

The three laws are:

«A robot may not injure a human being or, through inaction, allow a human being to come to harm.

A robot must obey the orders given it by human beings except where such orders would conflict with the First Law.

*A robot must protect its own existence as long as such protection does not conflict with the First or Second Laws.»*¹⁴¹ (Salge, 2017)

Actually, there is another zeroth law added later by the author:

«0. A robot may not harm humanity, or, by inaction, allow humanity to come to harm.»^{142, 143}.

Friedman and Nissenbaum pioneered the process “[...] of building systems for human-computer interaction that prioritize trust and user welfare while endeavoring to reduce biased outcomes.”¹⁴⁴

In a recent statement,¹⁴⁵ the United Nations’ Human Rights Chief, Michelle Bachelet, expressed her concern about AI technologies. For instance, one of the most recent are Pegasus revelations spread suggesting a software abuse.

*«The Pegasus malware infects electronic devices, enabling operators of the tool to obtain messages, photos and emails, record calls, and even activate microphones, according to the consortium’s reporting. The leak contains a list of more than 50,000 phone numbers which reportedly belong to those identified as people of interest, by clients of the company behind Pegasus, including some governments.»*¹⁴⁶

According to the report of the Organized Crime and Corruption Reporting Project (OCCRP) corrupt regimes can gain access to personal information about anyone they want, and it is also reported that has been used against journalists, activists and political dissidents¹⁴⁷.

The United Nations’ Human Rights Chief also addressed, in the same statement¹⁴⁸ the opaque deals of a different spyware, Candiru that emerged about the same time. Candiru «[...] is a secretive Israel-based company that sells spyware exclusively to governments. Reportedly, their spyware can infect and monitor iPhones, Androids, Macs, PCs, and cloud accounts.»

The report that targeted Candiru

«[...] identified more than 750 websites linked to Candiru’s spyware infrastructure. [...] many domains masquerading as advocacy organizations such as Amnesty International, the Black Lives Matter movement, as well as media companies, and other civil-society themed entities.» It was also identified «[...] a politically active victim in Western Europe and recovered a copy of Candiru’s Windows spyware.»¹⁴⁹

Although recognizing AI can be used to help societies to overcome challenges and improve people’s lives, it has also a negative side and it can affect human rights, democracy, and the rule of law.

In the report of Thorbjørn Jagland to the 129th Session of the Committee of Ministers, new challenges to humankind were emphasised

«[...] for which Council of Europe legal standards are required. Three immediate challenges stand out: how to harness the benefits of the artificial intelligence revolution, while identifying and mitigating its threat to human rights, democracy and the rule of law»¹⁵⁰.

These risks are not a price to pay, and Michelle Bachelet calls for an urgent action to assess the risks, and concluded that *«[...] until compliance with human rights standards can be guaranteed, governments should implement a moratorium on the sale and transfer of surveillance technology.»* (Bachelet, 2021)

In fact, the examples teem.

For instance, ProPublica analysed a commercial AI tool made by Northpointe, Inc. and tested whether the recidivism algorithm¹⁵¹, the Correctional Offender Management Profiling for Alternative Sanctions (COMPAS) used in the US judicial system, was predisposed against certain groups¹⁵².

The analysis, reported on May 23, 2016 - «How we analysed the COMPAS Recidivism Algorithm» -, found that black defendants were more likely, than white ones, to be incorrectly judge to be at higher risk of re-offense¹⁵³. The report concluded that:

«Black defendants were twice as likely as white defendants to be misclassified as a higher risk of violent recidivism, and white recidivists were misclassified as low risk 63.2 percent more often than black defendants. Black defendants who were classified as a higher risk of violent recidivism did recidivate at a slightly higher rate than white defendants (21 percent vs. 17 percent), and the likelihood ratio for white defendants was higher, 2.03, than for black defendants, 1.62.»¹⁵⁴

The algorithms depend mostly on the data fed to them and, if so, they will reproduce and recreate bias and stereotypes¹⁵⁵,¹⁵⁶,¹⁵⁷ and, data fundamentalism¹⁵⁸ can represent a true threat to many people and impact their lives negatively.

Although, besides this particular level, another one needs to be considered. The confrontation with IP rights and transparency.

A significant case was discussed in the USA. In the case *Wisconsin v. Loomis*¹⁵⁹ the Wisconsin Supreme Court analyzed for the first time the use of algorithms and the right to a due process¹⁶⁰. Loomis defense argued that, among others,

it was not possible to know and understand how the algorithms used predicted the defendant's recidivism since it was protected by IP rights. The defendant was unable to challenge the validity of the risk assessment produced by COMPAS tools.

The European Commission for the Efficiency of Justice (CEPEJ) in its European ethical Charter on the use of Artificial Intelligence in judicial systems and their environment ¹⁶¹ addressed the specific issues to criminal justice, especially prevention of offences, risk of recidivism and assessment of the level of danger ¹⁶². The CEPEJ addressed the potential risks of discrimination considering the AI Tools are

«[...] constructed and interpreted by humans, can reproduce unjustified and already existing inequalities in the criminal justice system concerned; instead of correcting certain problematic policies, technology may end up legitimizing them.» ¹⁶³

The Charter defined five core principles in the field of Artificial Intelligence and justice: respect of fundamental rights, non-discrimination, quality and security, transparency, impartiality, and fairness, “under user control”.

Also, the European Parliament resolution on AI in criminal law and its use by the police and judicial authorities in criminal matters

«[...] recalls that the inclusion in AI training data sets of instances of racism by police forces in fulfilling their duties will inevitably lead to racist bias in AI-generated findings, scores, and recommendations; reiterates its call on Member States, therefore, to promote anti-discrimination policies and to develop national action plans against racism in the field of policing and the justice system; [...]» ¹⁶⁴

The Parliament also underlines that many algorithmically driven identification technologies «[...] disproportionately misidentify and misclassify and therefore cause harm to racialized people, individuals belonging to certain ethnic communities, LGBTI people, children and the elderly, as well as women; [...]» ^{165, 166}.

Besides that, the lack of representativeness ¹⁶⁷ can condemn many, and their specific issues, to a limbo ¹⁶⁸.

For instance, Sacha Costanza-Chock explains, from a personal experience point of view, as a non-binary trans female, some issues not easily resolved by

algorithms ¹⁶⁹ since they are encoded through the design of norms, values and assumptions that leaves (or can leave) many behind. The author explains that «[...] *the current path of AI development will produce systems that erase those of us on the margins [...]*» ¹⁷⁰.

A clear example is the automatic gender recognition (AGR) that assumes that «[...] *gender is a static concept that does not frequently change across time and cultures.*» ¹⁷¹ The simplistic way, to say the least, to present gender can have highly negative outcomes to transgender community.

In another perspective, but considering the same concern, i.e., the particular queries within the margin population, Petra Molnar debates how technology is used in the migration queries and how, in her perspective, the States explore new technologies but, mainly, the lack of international regulation, to deal with migration ¹⁷².

The issues raised by race, class, and gender inequality through AI have been addressed and the author recalls Crenshaw's intersectional analyzes ¹⁷³, as a powerful tool for the development of AI. A non-intersectional «[...] *algorithmic bias audits are insufficient to ensure algorithmic fairness.*» ¹⁷⁴

In AI systems we have some other examples that emerge. For instance, in 2018 Reuters reported that Amazon.com Inc's AMZN.O machine learning specialist uncovered that «[...] *their new recruiting engine did not like women.*» ¹⁷⁵ The hiring automate tool reflected a male dominance so, therefore, the Amazon's AI systems learned that male candidates were more suitable than the female candidates ¹⁷⁶.

Although, we might also consider another level of issues related to data. Synthetic data, which is generated artificially ¹⁷⁷. Some of the main challenges is how synthetic data is produced, how to ensure the characteristics between the original and synthetic data and what method and how to measure it ¹⁷⁸.

The matter of bias and discrimination is specifically addressed in the Executive Office of the President's Report ¹⁷⁹ that grouped the challenges to promote fairness and overcoming the discriminatory effects of data: challenges related to the data used as inputs and challenges related to the inner workings of the algorithm itself. In the first group, the report the decision to use certain data inputs can result in discriminatory outputs. Such as poorly selected data, incomplete, incorrect, or outdated data, selection bias, and unintentional perpetuation and promotion of historical biases.

On the second group, the report highlights the flaws related to poorly designed matching systems, personalization and recommendation services that narrow instead of expand user options, decision-making systems that assume correlation necessarily implies causation, data sets that lack information or disproportionately represent certain populations¹⁸⁰, and that algorithms encode discrimination and bias outputs related to the different participation in the digital ecosystem, «[...] *due to economic, linguistic, structural or socioeconomical barriers, among others.*»¹⁸¹

The 2019 Declaration adopted by the Committee of Ministers on the manipulative capabilities of algorithmic processes raised recalled about the fast-growing presence of technology in our lives. Although public in general is not aware the extent of data collection everyday devices gather and how «[t]hese data are used to train machine-learning technologies to prioritise search results, to predict and shape personal preferences, to alter information flows, and, sometimes, to subject individuals to behavioural experimentation.»¹⁸²

It is undeniable that AI entrenches bias, and, for that reason, outputs can not only replicate but also amplify it and, even, be weaponized against certain groups of people. In another aspect, AI is mainly a product of the Global North and, if so, «*if privileged white men are designing the technology and business models of AI, how they design for the south?*»¹⁸³

Therefore, not only the amount of data is crucial to mitigate discriminatory outputs but also, guarantee a diversity of data to cover most spectrums. And, besides the substantial and diverse data, as stated by the AI Act, it is an obligation of States for *ex ante* test, manage risk and guarantee human oversight and, also, to guarantee that AI systems maintain «[...] *its level of performance under any circumstances*»¹⁸⁴. These obligations will facilitate the respect of other fundamental rights by minimising the risk of erroneous or biased AI-assisted decisions.

Promoting a fair and impartial AI embraces, as an imperative, diversity and inclusion.

On February 2022, the UN Human Rights Office of the High Commissioner released information about how proper data collection can change people's lives, «*in a people-centred approach to data collection*» referred by the UN Assistant Secretary-General for Human Rights, Ilze Brands Kehris. The UN Assistant Secretary-General referred specifically to the

«[...] lack of data, disaggregated by race or ethnic origin, as well as by gender, age, and other factors, hides the disproportionate impact of certain laws, policies and practices on racial or ethnic groups in all areas of life, from housing and education to employment, health and the criminal justice system.»¹⁸⁵

On September 2019, the Council of Europe's (CoE) Committee of Ministers adopted the terms of reference for the Ad Hoc Committee on Artificial Intelligence (CAHAI), mandated

«[...] to examine, on the basis of broad multi-stakeholder consultations, the feasibility and potential elements of a legal framework for the development, design and application of artificial intelligence, based on the Council of Europe's standards on human rights, democracy and the rule of law.»^{186, 187}

In December 2020, CAHAI published a compilation of contributions¹⁸⁸ and adopted its Feasibility Study on a legal framework on AI design, development and application based on CoE standards^{189, 190}.

The Alan Turing Institute prepared a program to support the Feasibility Study published by the Council of Europe's Ad Hoc Committee on Artificial Intelligence. The Human Rights, Democracy and the Rule of Law Assurance Framework (HUDERAF) was completed in September 2021 and *«[...] combines the procedural requirements for principles-based human rights due diligence with the governance mechanisms needed to set up technical and socio-technical guardrails for responsible and trustworthy AI innovation practices»¹⁹¹.*

The range of decisions that AI systems can take have – as the examples demonstrates – a direct impact at a HR level, especially from the most vulnerable ones.

The acknowledgement that AI has a significant impact on people's lives – individually, socially, and politically – urges not only policymakers, but also technological companies¹⁹² and other stakeholders, including non-profit organizations and academia¹⁹³, to recognize the need for an AI Ethics. There are several examples of international efforts¹⁹⁴. For instance, the Toronto Declaration led by Amnesty International and digital rights group AccessNow¹⁹⁵, the Montreal Declaration for a responsible AI was an initiative of the Université de Montréal¹⁹⁶, the Asimolar AI principles¹⁹⁷, the Barcelona Declaration¹⁹⁸, ethical guidelines

from the Japanese Society for Artificial Intelligence¹⁹⁹, or the UNI Global Union Top 10 Principles for Ethical AI²⁰⁰.

At the EU level, on 2018, the European Group on Ethics in Science and New Technologies also published a relevant statement on AI, Robotics and ‘Autonomous’ Systems and proposed a set of basic principles and democratic prerequisites, based on fundamental values: human dignity, autonomy, responsibility, justice, equity and solidarity, democracy, rule of law and accountability, security, safety, bodily and mental integrity, data protection and privacy and sustainability²⁰¹.

On November 2021, UNESCO adopted the Recommendation of the Ethics of AI²⁰². Among its values, it establishes the respect, protection and promotion of human rights and fundamental freedoms, and human dignity, ensuring diversity and inclusiveness, living in peaceful, just, and interconnected societies.

The core principles listed are proportionality and do no harm, safety and security, fairness and non-discrimination, sustainability, privacy and data protection, human oversight and determination, transparency and explainability, responsibility and accountability, awareness and literacy and multi-stakeholder and adaptive governance and collaboration.

Trust in technology is a key feature and the primary reason for acceptance. Building trust in technology – the digital trust – depends on several factors²⁰³. Keng Siau and Weiyu Wang list them as human, technology, and environment characteristics²⁰⁴. Paying special attention to the environment characteristics, trust incorporates also a cultural dimension²⁰⁵.

Huang and Bashir conducted a survey, and the results indicate a correlation between cultural values and trust²⁰⁶. For instance, Tae Wan Kim, Tong (Joy) Lu, Kyusong Lee, Zhaoqi Cheng, Yanhan Tang and John Hooker analysed the tolerability of lying and deception in Conversational Artificial Intelligence (CAI) and how a cultural-specific approach influenced the response to permissibility or impermissibility^{207, 208}. The authors analyse the different manners in negation considering different cultures and different behavioural norms suggesting that if, for example

«[...] the degree of invitation of trust in human-to-human price negotiation in a Scandinavian country is believed to be significantly higher than in the U.S.

*The same thing can happen in Human-to-AI interaction. Then, a conversational AI ethically optimized for U.S. consumers is not ethically ideal for consumers in Scandinavian countries.»*²⁰⁹

Such sectorial aspects should be taken into account especially considering the different AI domestic legal solutions that can (or already have) been adopted, moreover since an active policymaking on AI has recently emerged at the national level²¹⁰.

In addition, besides the socio-cultural level, a religious level should not be erased, and it should be particularly interesting to, also, address a conversation between AI and religion. A theological approach can contribute to a critical thinking considering, to begin with, the impact AI has on the conceptions of the human being, the personhood, the world²¹¹.

The topic will need further study, but we can already say that AI will push religious boundaries and conceptions²¹², on one side and, on another one, it assumes a stimulating critical perspective on AI²¹³ since religions integrate many of the challenges that AI arises²¹⁴.

Our aim is to highlight a necessary democratic domain in AI Ethics but, also, a diversity one, able to accommodate relevant cultural aspects and how they can point to different ethical approaches. We have to make clear that we are not defending a relativist approach, especially considering the human rights arena where the subject is inserted. Although, it is critical to accommodate social-cultural differences, as Stephen Cory Robinson concludes, «[...] *to understand how cultural values interact with policy discussions about technologies such as AI*»²¹⁵.

The Ethics Guidelines for a Trustworthy AI²¹⁶ brings together different stakeholders and works upon the European Group on Ethics in Science and New Technologies progress on the matter.

The Guidelines address the impact of AI on fundamental rights and establishes three components for a trustworthy AI:

- «1. it should be lawful, complying with all applicable laws and regulations;*
- 2. it should be ethical, ensuring adherence to ethical principles and values; and*
- 3. it should be robust, both from a technical and social perspective, since, even with good intentions, AI systems can cause unintentional harm.»*^{217, 218}

The document sets key requirements for AI to be deemed trustworthy: human agency and oversight; technical robustness and safety; privacy and data governance; transparency; diversity, non-discrimination, and fairness; societal and environmental well-being and accountability ²¹⁹.

Although, if the most challenging quest is to align AI goals and human rights, it is also imperative to have in mind the sense of the big picture, where no one is left behind.

6. AI literacy for a democratic dialogue and a legal-ethical sustainable development

«AI is everyone's business!»

This is the motto of UNESCO to make AI part of our – everyone's – debates ²²⁰. In order to comply to Article 27 of the Universal Declaration of Human Rights it is essential to ensure everyone's participation, promote diversity, including the data collection and classification ^{221, 222}, and access to technology.

Public awareness and literacy for AI is an imperative.

Understanding the different nuances and consequences is the only route to ensure that everyone single person can and is able to take an active role in the democratic dialogue about AI and is able to take informed decisions about the use of AI systems and the consequences of its use. As stated by UNESCO

«Learning about the impact of AI systems should include learning about, through and for human rights and fundamental freedoms, meaning that the approach and understanding of AI systems should be grounded by their impact on human rights and access to rights, as well as on the environment and ecosystems.» ²²³

Public awareness about social good can influence corporate social responsibility (CSR), that can include the ethics of AI that can help «[...] *bring together the notions of the social contract and responsible AI use.*» ²²⁴

In fact, public must be prepared for AI, and this demands that education is required. Also, education depends on some variables, like the recipients, the speaker, and the context.

A public empowerment through education ²²⁵, to participate in decisional processes that are critical to shape our future. The HR approach to an ethical AI centrally claims self-determination through the means of democracy.

In 2016, the European Commission adopted a plan to enhance education related to labour market. The «New skills Agenda for Europe»²²⁶, ²²⁷ and the «Digital Education action Plan» ²²⁸.

In fact, «technological unemployment» is a main concern. Like the industrial revolution, the labour force and labour market are changing ²²⁹.

A model of «*Explainable Artificial Intelligence (XAI)*», in the words of Martin Ebers, is not only relevant to the professionals ²³⁰, but also to all of those that might be affected by it ²³¹. Truth is that explainability demands for educated people, not only capable to understand the information, but also make critical assessments about it.

The «digital divide» ²³² can exacerbate inequalities, bias, and exclusion and it is crucial to continue to question and test the inputs and the results they produce, the algorithm «black box» ²³³.

Transparency in AI is also a key element in AI systems. The OECD Recommendation recalls that, not only AI actors, should commit to transparency and disclosure but also to «[...] *provide meaningful information, appropriate to the context* [...]» ²³⁴, the burden and responsibility to assure that recipients fully understand and interpret information. To achieve transparency AI system's decisions has to be traceable, explainable, and whether the AI system's capabilities and limitations have been communicated to recipients ²³⁵.

The Committee of Ministers encouraged Member States to promote digital literacy and enhance public awareness, «[s]pecifically, *public awareness should be enhanced of the fact that algorithmic tools are widely used for commercial purposes and, increasingly, for political reasons, as well as for ambitions of anti- or undemocratic power gain, warfare, or to inflict direct harm;*» ²³⁶

In addition, domestic plans are considered a key aspect to address the issue to empower people through education and skills. Von der Leyen is committed to make the European Education Area a reality by 2025, bringing down barriers to learning and improve access to quality education, aligning the efforts to the Sustainable Development Goals of the UN also in AI area ²³⁷, ²³⁸.

7. Conclusions

This Chapter has highlighted the tension between AI and, HR, Democracy, and the Rule of Law, and the need to deliver an Ethical AI.

Identify the core values to establish ethical standards is imperative, and a substantial input from the public in general, and diverse stakeholders, guarantees a most-needed democratic dialogue and, also, that no one is left behind.

AI is up-to-date largely unregulated and a claim to a legislative movement is necessary. Like the new general data protection regulation (GDPR) ²³⁹ is a clear example of the relevance of changes and legislative initiatives that comes with progress of technology towards the public interest ²⁴⁰.

Complex technological innovations developed and applied under opaque procedures difficult evaluation and assessment, and, with limited control, comes limited accountability. Not only in the outcomes produced but also in the AI architecture itself. Legislative initiatives to regulate AI systems – like the EU AI Act ²⁴¹ – support the need for a homogenous legal regime that can address the multiple policy goals in order to protect people's rights, especially our fundamental rights and freedoms ²⁴².

In addition, it will also have to strengthen democracy and the rule of law, providing the necessary legal tools to combat the resistance to compliance and accountability to adequately protect those rights. It is especially important considering that technology and AI systems are a global phenomenon and do not recognize the physical frontiers of Nations and States.

Oversight, compliance, and accountability procedures are – within a legislative framework, based on ethical principles – imperative to protect the triad human rights, democracy, and the rule of law in the challenging AI arena.

8. A note on methodology

A study about an interdisciplinary and broad topic like the one presented in this Chapter is always a difficult academic quest. This study is fundamentally concerned on the ethical and legal implications of AI and AI-based systems and how human rights, democracy and the rule of law are affected by it. With this objective in mind, the study used qualitative methods, including legal, ethical and

philosophical analyses, resorting to the work developed by international actors, including ongoing and work in progress projects, over the topic and a review of literature related to the subject of this study.

9. Acknowledgements

The authors would like to express their gratitude to Lusíada University, CEJEA – Centre for Legal, Economic and Environmental Studies of said University and UNODC Mozambique.

10. Competing interests

The authors declare they have no competing interests.

11. Funding

This work was financed by national funds by FCT – Foundation for Science and Technology, under the Project UIDB/04053/2020.

NOTAS

- ¹ The term was introduced in the 1950's and was referred to machines that could do more than routine tasks (World Commission in the Ethics of Scientific Knowledge and Technology. (2019, February 26). Preliminary Study on the Ethics of Artificial Intelligence. Retrieved April 2, 2022, from <https://unesdoc.unesco.org/ark:/48223/pf0000367823>, p. 3.)
- ² The International Federation on Robotics distinguishes between industrial robots and service robots. The first is defined as «[...] an automatically controlled, reprogrammable multipurpose manipulator programmable in three or more axes.» The second is a robot that «[...] performs useful tasks for humans or equipment excluding industrial automation application.» (International Federation on Robotics. (n.d.). Topics and Definitions. Retrieved February 16, 2022, from <https://ifr.org/#topics>).
Although, terminology and definition are not unanimous within the scientific community.
Despite the no consensus, a lot has advanced since a sole master/slave definition. This notion evolved in 1920 by Karel Čapek's play, *Rossum's Universal Robots*, and «[...] Čapek's robots were mass produced workers assembled from artificially synthesized organic material.» (Wilson, H. J. (2015, April 15). What Is a Robot, Anyway? *Harvard Business Review*. Retrieved February 16, 2022, from <https://hbr.org/2015/04/what-is-a-robot-anyway>)
- ³ The study commissioned by the European Parliament's Legal Affairs Committee, European Civil Law Rules in Robotics, recalls for a common European definition of the various categories of autonomous robot. The notion of smart robot seems even harder. (Policy Department for "Citizens' Rights and Constitutional Affairs. (2016, October). European Civil Law Rules in Robotics. Retrieved February 17, 2022, from <http://www.europarl.europa.eu/committees/fr/supporting-analyses-search.html>, pp. 8-12).
- ⁴ The European Parliament resolution of 16 February 2017 with recommendations to the Commission on Civil Law Rules on Robotics (2015/2103(INL)) raised important questions and, mostly, deep concerns surrounding robots and their behavior.
- ⁵ The terms of an AI policy and framework are also crucial to the functionality of robots.
- ⁶ Robots are increasingly assuming some important domains, For instance, according to the Science and Technology Directorate, can «[...] assist with enhancing capabilities of CBP [U.S. Customs and Border Protection] personnel, while simultaneously increasing their safety downrange.» (Science and Technology Directorate. (2022, February 1). Feature Article: Robot Dogs Take Another Step Towards Deployment at the Border. Retrieved February 20, 2022, from <https://www.dhs.gov/science-and-technology/news/2022/02/01/feature-article-robot-dogs-take-another-step-towards-deployment>).
- ⁷ Traditionally medicine is reactive. AI is enhancing P4 Medicine. A predictive, preventive, personalized and participatory medicine. Pioneers of this approach to health care are Leroy Hood, James Heath, Michael Phelps, and Biaoyang Lin. In 2004, they have published a paper on Science about technologies enable predictive and Preventative Medicine. It will lead to a personalized medicine. See Hood, L., Heath, J. R., Phelps, M. E., & Lin, B. (2004, October 22). Systems Biology and New Technologies Enable Predictive and Preventative Medicine. *Science*, 306, Issue 5696, pp. 640-643. DOI: 10.1126/science.1104635
In 2021, researchers from Kaunas University of Technology and Vytautas Magnus University in Lithuania developed a deep learning-based method that can predict mild cognitive impairment and Alzheimer's disease with an accuracy of over 99%. See Odusami, M., Maskeliūnas, R., Damaševičius, R., & Krilavičius, T. (2021, June 10). Analysis of Features of Alzheimer's Disease: Detection of Early Stage from Functional Brain

Changes in Magnetic Resonance Images Using a Finetuned ResNet18 Network. *Diagnostics*, 11 (6). <https://doi.org/10.3390/diagnostics11061071>.

- ⁸ Although AI in biotechnology industry does not relate solely to programs that predict outcomes. We can also be used in drug discovery and development. Walters and Murcko published an article on Nature Biotechnology assessing the impact of generative AI on medicinal chemistry. See Walters, W. P., & Murcko, M. (2020, January 30). Assessing the impact of generative AI on medicinal chemistry. *Nature Biotechnology*, 38, pp. 143-145. Retrieved February 22, 2022, from <https://www.nature.com/articles/s41587-020-0418-2>.
- ⁹ Neuroscientists are also testing the limits creating a symbiotic relation between AI and neuroscience. A clear example are the research developments of AI to enable paralyzed people to use robotic limbs as their own. Researcher like Chethan Pandarinath are recording brain activity from paralyzed people hopping to «[...] identify the patterns of electrical activity in neurons that correspond to a person's attempt to move their arm in a particular way, so that the instructions can then be fed to a prosthesis.» (Savage, N. (2019, August 21). How AI and neuroscience drive each other forwards. *Nature*. Retrieved February 22, 2022, from <https://www.nature.com/articles/d41586-019-02212-4>).
- ¹⁰ Also, robotic chirurgic.
- ¹¹ For the information society, in a related topic, the internet of things (IoT). The IoT is a «[...] global infrastructure for the information society, enabling advanced services by interconnecting (physical and virtual) things based on existing and evolving interoperable information and communication technologies.» (International Telecommunication Union. (2012, June 15). Overview of the Internet of things. Recommendation ITU-T Y.2060. Retrieved March 23, 2022, from <https://www.itu.int/ITU-T/recommendations/rec.aspx?rec=y.2060>, p. 1).
- ¹² «[R]efers to large amount of data produced very quickly by a number of diverse sources. Data can either be created by people or generated by machines, such as sensors gathering climate information, satellite imagery, digital pictures and videos, purchase transaction records, GPS signals, and more.» (European Commission. (2021, December 13). Big Data. Retrieved February 15, 2022, from <https://digital-strategy.ec.europa.eu/en/policies/big-data>).
- ¹³ In the article published by Sabyasachi Dash, Sushil Kumar Shakyawar, Mohit Sharma e Sandeep Kaushi the «International Data Corporation (IDC) estimated the approximate size of the digital universe in 2005 to be 130 exabytes (EB). The digital universe in 2017 expanded to about 16,000 EB or 16 zettabytes (ZB). IDC predicted that the digital universe would expand to 40,000 EB by the year 2020» (Dash, S., Shakyawar, S. K., Sharma, M., & Kaushik, S. (2019). Big data in healthcare: management, analysis and future prospects. *Journal of Big Data*, 6:54, 1-25. doi: <https://doi.org/10.1186/s40537-019-0217-0>, p. 3).
- ¹⁴ European Commission, Communication from the Commission on Artificial Intelligence for Europe COM(2018) 237 final, 2018.
- ¹⁵ Automated machine learning «[...] refers to the tools and processes which make it easy to build, train, deploy and serve custom machine learning models.» (Qlik. (n.d.). AutoML. What it is, why you need it, and best practices. Retrieved February 20, 2022, from <https://www.qlik.com/us/augmented-analytics/automl>).
- ¹⁶ The «[...] use of algorithms that find a pattern in data without explicit instructions» is machine-learning and «[a] system might learn how to associate features of inputs such as images with outputs such as labels.» (Hutson, M. (2017, July 7). AI Glossary: Artificial intelligence, in so many words. *Science*, 357, Issue 6346, <https://www.science.org/doi/10.1126/science.357.6346.19>, p. 19).

The algorithms are a *finite sequence of formal rules (logical operations and instructions) making it possible to obtain a result from the initial input of information. This sequence may be part of an automated execution process and draw on models designed through machine learning.*» (European Commission for the Efficiency of Justice. (2018, December 3-4). *European Ethical Charter on the Use of Artificial Intelligence in Judicial Systems and their environment*. Retrieved April 3, 2022, from <https://rm.coe.int/ethical-charter-en-for-publication-4-december-2018/16808f699c>, p. 69).

Machine learning

«[M]akes it possible to construct a mathematical model from data, incorporating a large number of variables that are not known in advance. The parameters are configured gradually during the learning phase, which uses training

data sets to find and classify links. The different methods of machine learning are chosen by the designers depending on the nature of the tasks to be completed (grouping). These methods are usually classified into three categories: (human) supervised learning, unsupervised learning and reinforcement learning. These three categories group together different methods including neural networks, deep learning, etc.» (Ibid, p. 72).

ML can be sub-categorized into three types of learning: supervised learning, unsupervised learning, and reinforced learning. (Bartneck, C., Lütge, C., Wagner, A., & Welsh, S. (2021). *An Introduction to Ethics in Robotics and AI*. Springer, p. 25).

- ¹⁷ We can also include some subfields as
«[...] *deep learning, which uses neural networks to identify complex patterns in high-volume data, cognitive computing, which is used to simulate the functioning of the human brain to solve complex problems, and natural language processing, which helps computers understand and interpret human language.*» (Qlik. (n.d.). *Big Data AI. How Big Data and AI Work Together*. Retrieved February 20, 2022, from <https://www.qlik.com/us/augmented-analytics/big-data-ai>).

⁶¹ Three levels of risk: unacceptable risk; high risk; and low/minimal risk.

Under Title II of the AI Act, article 5 lists prohibited AI systems considering the unacceptable risk to society, including systems that distort a person's behavior, exploits any vulnerabilities of a specific group, social scoring.

High-Risk AI Systems are classified in article 6 and are considered as such when fulfilling two conditions:

«(a) the AI system is intended to be used as a safety component of a product, or is itself a product, covered by the Union harmonisation legislation listed in Annex II;

(b) the product whose safety component is the AI system, or the AI system itself as a product, is required to undergo a third-party conformity assessment with a view to the placing on the market or putting into service of that product pursuant to the Union harmonisation legislation listed in Annex II.»

These AI systems are not prohibited although a strict regulation is proposed.

The low/minimal risk AI systems are the ones that are not prohibited nor the ones that are considered high-risk. Although the Act encourages, in its article 69, the

«[...] drawing up of codes of conduct intended to foster the voluntary application to AI systems other than high-risk AI systems of the requirements set out in Title III, Chapter 2 on the basis of technical specifications and solutions that are appropriate means of ensuring compliance with such requirements in light of the intended purpose of the systems»

⁶² Included at the Charter of Fundamental Rights of the European Union that brings together personal, civic, political, and also social and economic rights.

⁶³ Set out in Article 2 of the Treaty on European Union.

- ⁸² In the 1980's John Searle divided AI in two categories. Weak and strong AI, depending on if AI is limited to a single task or programmed computer that would have a mind in exactly the same sense of a human mind, something like a general intelligence. (Bartneck, Lütge, Wagner, & Welsh, op. cit., p. 24).
- ⁸³ Ibid, p. 44.
- ⁸⁴ Considering the subject, we can divide AI two categories: narrow AI (ANI) and general AI (AGI).
«An AGI, like us, could drive a car, have a conversation, play chess, and read and produce a summary of a paper. Perhaps not all at the same time, but importantly AGI is not limited to a single domain. We currently do not have an AGI, and A.I. researchers do not have clarity regarding when or if we will. [...] Narrow artificial intelligence is often talked about as deep learning and sometimes as machine learning [...]. » (Reed, R. (2021, May 31). A.I. in Religion, A.I. for Religion, A.I. and Religion: Towards a Theory of Religious Studies and Artificial Intelligence. *Religions*, 12. doi: <https://doi.org/10.3390/rel12060401>, p. 3).
ANI performs four different tasks: «classification, prediction, generation (Reed quotes Mitchell, Melanie. 2020. *Artificial Intelligence: A Guide for Thinking Humans*. Stuttgart: Picador) and also «[...] reinforcement learning, which attempts to learn through trial and error by maximizing a reward signal» Ibid.

¹⁶⁶ It seems hard to understand, for example, granting humanoid robot Sophia the Saudi Arabian citizenship in 2017 and women struggle against discrimination. Not much more than a publicity stunt Sophia represents, however, the mystique around robots.

In a very interesting perspective Joshua C. Gellers presents a theory about the *status* robots and question «*can robots have rights?*» (Gellers, J. C. (2021). *Rights for Robots: Artificial Intelligence, Animal and Environmental Law*. New York: Routledge, p. 15).

In fact, we can understand the responsibilities that we have to sentient beings and «[a]ll currently existing artificial entities are nonsentient but – unlike a rock – their interactions and designs evoke the impression of conscious entities with personalities and emotions.» (Donath, J. (2020). Ethical Issues in our Relationship with Artificial Entities. In M. D. Dubber, & S. D. Frank Pasquale, *The Oxford Handbook of Ethics of AI* (pp. 52-73). Oxford: Oxford University Press, p. 53).

This topic is quite interesting, OECD and the UK have been recommending that «[...] *AI should never deceptively appear to be human.*» (Bryson, 2020, *The Artificial Intelligence of the Ethics of Artificial Intelligence: An Introductory Overview for Law and Regulation*, p. 22). The quote is referring to the OECD AI ethics principles (OECD Council, 2019, *Recommendation on Artificial Intelligence*).

¹⁶⁷ For instance, racial representation emerged by research «[...] demonstrating facial recognition technology's difficulty recognizing people of color (especially black people), companies like Microsoft began touting “inclusivity” efforts aimed at improving facial recognition's performance across skin tones.» (Greene, Hoffmann, & Stark, op. cit., p. 2123).

¹⁶⁸ AI and algorithms are used in «decision making» tools and questions related to human rights led the Committee of Ministers of the Council of Europe to adopt a Declaration on the risks of computer-assisted or artificial-intelligence-enabled decision making in the field of social safety net on 17 March 2021 at the 1399th meeting of Ministers' Deputies.

The Committee urged Member states to have special attention, amongst other recommendation, to «*the possible risks to human rights, including social rights, that might follow from the use of computer-assisted or AI-enabled decision making by public authorities in the area of social services, when no qualified supervision is guaranteed, in particular as regards the management, attribution or revocation of entitlements, assistance and related benefits.*» (Committee of Ministers. (2021, March 17). Declaration by the Committee of Ministers on the risks of computer-assisted or artificial-intelligence-enabled decision making in the field of the social safety net. *Decl(17/03/2021)2*. Retrieved February 16, 2022, from https://search.coe.int/cm/Pages/result_details.aspx?ObjectId=0900001680a1cb98).

It also should be ensured decision-making systems comply with the legal principles of certainty, legality, data quality, non-discrimination and transparency.

¹⁶⁹ She explains her experience in the airport security protocol. (Costanza-Chock, S. (2018, July 18). Design Justice, A.I., and Escape from the Matrix of Domination. *Journal of Design and Science*. doi:10.21428/96c8d426).

- ²¹¹ See Singler, B. (2017). An Introduction to Artificial Intelligence and Religion For the Religious Studies Scholar. *The Faraday Institute for Science and Religion*, 215-231. doi:10.1558/imre.35901.
- ²¹² Alternatively, create new religions such as «Data-ism» that Yuval Harari presented (Harari, Y. (2017). *Homo Deus: A Brief History of Tomorrow*. Random House).
- ²¹³ In another perspective, AI can also contribute to Religious Studies. See, for example, Reed, op. cit.
- ²¹⁴ For instance, and just to state an example about the role of the Catholic Church in the challenges presented to humankind, the Catholic Church reaction to the industrial revolution and the Communist Manifesto from

Marx and Engels. The Church reacted through Pope Leo XII and His Encyclical Rerum Novarum. (Almeida Araújo, M., & Meireis, A. (2019). Understanding Dignity (of Workers) across the Catholic Thought. *Minerva: Revista de Estudos Laborais*, 27-62. Retrieved from https://www.researchgate.net/publication/339845373_UNDERSTANDING_DIGNITY_OF_WORKERS_ACROSS_THE_CATHOLIC_THOUGHT, p. 37). For a developed study about the topic see Moreira, A. J. (2021). *Escravidão, Dignidade e Trabalho*. Coimbra: Almedina.

Today AI also presents new challenges to labour and employment and is an imperative to the «*post-work future*», using Singler's expression (Singler, op. cit., p. 221).

²¹⁵ Robinson, op. cit., p. 13.

²¹⁶ The High-level expert group on AI was appointed by the European Commission and, besides the Ethics Guidelines for Trustworthy AI (Independent High-Level Expert Group on Artificial Intelligence to the European Commission, 2019), the group also delivered the Policy and Investment Recommendations for Trustworthy AI (Independent High-Level Expert Group on Artificial Intelligence to the European Commission, 2019), the final Assessment List for Trustworthy AI (ALTAI) (Independent High-Level Expert Group on Artificial Intelligence, 2020) and a Sectoral Considerations on the Policy and Investment Recommendations (Independent High-Level Expert Group on Artificial Intelligence, 2020).

²¹⁷ Independent High-Level Expert Group on Artificial Intelligence to the European Commission, 2019, p. 5.

²¹⁸ To sum it, it has to be «[...] fair and impartial; robust and reliable; respectful of privacy; safe and secure; responsible and accountable; and transparent and explainable.» (Ammanath, op. cit., p. 9).

²¹⁹ Independent High-Level Expert Group on Artificial Intelligence to the European Commission, 2019.

²²⁰ See AI: examples of ethical dilemmas. Available at <https://en.unesco.org/artificial-intelligence/ethics/cases> [last accessed April 19, 2022].

²²¹ The performance of AI machines depends on the data, but the way data is collected, and classified is also culture-specific. World Commission in the Ethics of Scientific Knowledge and Technology, 2019, Preliminary Study on the Ethics of Artificial Intelligence, p. 7.

²²² Algorithms are modelled and produced in the social world and, so, they should not be seen outside their context. «Their existence and design are a product of social forces, as are their implementations and redesigns» Beer, D. (2017). The social power of algorithms. *Information, Communication & Society*, 20:1, 1-13. doi: <https://doi.org/10.1080/1369118X.2016.1216147>, p. 4.
